

Safety OK

The **Safety OK** was written for ObjectDock's taskbar in mind, for the purpose to lock and block unwanted access to the desktop, the taskbar, the start button and certain keyboard and mouse functions whilst still being able to gain access to the internet via your favourite web browser – this is great for the kids! They just need to click on the WWW icon on its interface to surf the internet and you can leave them without the worry of them deleting or disrupting any of your files.

All keyboard keys are blocked accept: A-Z, 0-9, Spacebar, Caps Lock, Shift and Enter – and only the left mouse button will function.

INSTALLATION:

Just extract the contents into the ObjectDock's directory and then drag the "Safety OK.exe" onto the ObjectDock's taskbar and then restart ObjectDock (restart is required to prevent glitches).

Also bear in mind that it will shut down ObjectDock whilst it is in operation to prevent it from popping on top of the **Safety OK** interface and being accessed by unwanted fingers. ObjectDock will automatically reopen once you terminate **Safety OK**.

PLEASE NOTE: be aware that once you are in this program it can only be terminated by pressing the "X" key and then the Left Mouse Button together.

If you have any further suggestions please feel free to let me know and I would be more than happy to contribute your ideas. Post a comment message on the programs listing page on the <http://www.wincustomize.com/> website.

Thank you.
